DETAILED ACTION

Response to Amendment

1. In response to the Final Office Action mailed 8/6/10, applicant has submitted an amendment and Request for Continued Examination filed 11/8/10.

Claims 1, 23, 33, 60-63, have been amended.

Allowable Subject Matter

1. Claims 1-18, 20-63, are allowed.
2. As per Claims 1, 23, 33, 60-63 (and their corresponding dependent claims):

The prior art of record does not teach the combination of limitations in the independent claims, including "evaluating the at least one voice interaction with at least one automatic speech recognition component adapted to analyze the at least one voice interaction, wherein the at least one voice interaction is divided into viewable panel-level segments and a panel-level time displacement stamp is assigned to each of the panel-level segments, wherein each panel-level segment is compared with a corresponding expected text, wherein a confidence level threshold of the automatic speech recognition component is used to evaluate the accuracy of each panel-level segment based on an output of a comparison between each panel-level segment and its (respective?) corresponding expected text, wherein a score is assigned to each panel-level segment, each score indicating a match accuracy between the panel-level segment to which it is assigned and its assigned panel-level segment's corresponding expected text, wherein the scores are evaluated against a standard, the standard defining a required score for

each of the panel-level segments to be declared as a match to their (respective?) corresponding expected texts"

Shambaugh et al. (US 6,970,821) teaches determining whether the at least one agent has adequately followed the at least one script ("compare the script presented to the selected agent with the recognized words... used by the agent", col. 6, lines 4-20), by dividing the voice interaction into viewable panel-level segments ("display an initial portion of the script", col. 3, lines 53-61; where a portion is put into the screen where the portion of the screen that the portion is displayed on is a "panel") and comparing the panel-level segments to the automatic speech recognition analyzed voice interaction ("compare the script presented to the selected agent with the recognized words... used by the agent", col. 6, lines 4-20)

applying a set of action rules to an output of the comparing to direct a quality assurance action to be taken, and wherein the action rules comprise a quality assurance action taken ("scripting system may extend the storyline", col. 5, lines 28-43; "detect any differences... incorporated into script... incorporate subtleties... parenthetical instructions", col. 6, lines 4-20; "objective", col. 6, lines 28-37; where a difference between the script and agent speech is an output of the comparing and also "if there is a difference and if the agent is successful, then add the difference to the script" and "if there is a difference to be added, determine corresponding parenthetical instructions" are rules applied to the difference/output to improve the odds that sales will be successful, which assures quality).

Yuschik (US 6,526,382) teaches wherein a panel-level time displacement stamp is assigned to each panel ("menu states... and timing for the flow of a dialogue", col. 5, line 61 – col. 6, line 12; "easy to understand... signal when it is time for the user to respond", col. 14, lines 1-13).

Young et al. (US 2003/0154072; continuation of 09/535,155, filed 3/24/2000, which incorporates the cited passages) suggests scores for comparison and presumably some sort of threshold for acceptability, but not where the scores are assigned to different panel-level segments ("score... that measures the correspondence of the agent's speech with the provided script", paragraph 37; "readability... overwhelm callers with technical jargon", paragraph 38; where the logical response to a script with overwhelming technical jargon is to modify it, as Shambaugh does)

And where the automatic speech recognition component has a confidence level threshold ("speech recognition system's confidence", paragraph 28; where it is at least obvious that if the system has low confidence in a recognition result that it is discarded instead of accepted, and the point at which the system determines that the result is acceptable is a threshold)

The prior art, while teaching compliance and scores, does not teach the combination of limitations, including where the scores being evaluated against a threshold/standard are each and every score assigned to viewable panel-level segments with respective timestamps which are compared to a corresponding expected text to determine a match, and the threshold/standard defining a required score for EACH of the panel-level segments to be declared as a match.
